# 1 Analysis

## 1.1 About

Artificial Intelligence mimics human cognition in order to perform tasks and learn from them, Machine Learning is a subfield of Artificial Intelligence that uses algorithms trained on data to produce models (trained programs) and Deep Learning is a subfield of Machine Learning that uses Artificial Neural Networks, a process of learning from data inspired by the human brain. Artificial Neural Networks can be trained to learn a vast number of problems, such as Image Recognition, and have uses across multiple fields, such as medical imaging in hospitals. This project is an investigation into how Artificial Neural Networks work, the effects of changing their hyper-parameters and their applications in Image Recognition. To achieve this, I will derive and research all theory behind the project, using sources such as IBM's online research, and develop Neural Networks from first principles without the use of any third-party Machine Learning libraries. I then will implement the Artificial Neural Networks in Image Recognition, by creating trained models and will allow for experimentation of the hyper-parameters of each model to allow for comparisons between each model's performances, via a Graphical User Interface.

## 1.2 Interview

In order to gain a better foundation for my investigation, I presented my prototype code and interviewed the head of Artificial Intelligence at Cambridge Consultants for input on what they would like to see in my project, these were their responses:

- Q: "Are there any good resources you would recommend for learning the theory behind how Artificial Neural Networks work?"  
A: "There are lots of useful free resources on the internet to use. I particularly like the platform 'Medium' which offers many scientific articles as well as more obvious resources such as IBMs'."
- Q: "What do you think would be a good goal for my project?"  
A: "I think it would be great to aim for applying the Neural Networks on Image Recognition for some famous datasets. For you, I would recommend the MNIST dataset as a goal."
- Q: "What features of the Artificial Neural Networks would you like to be able to experiment with?"  
A: "I'd like to be able to experiment with the number of layers and the number of neurons in each layer, and then be able to see how these changes effect the performance of the model. I can see that you've utilised the Sigmoid transfer function and I would recommend having the option to test alternatives such as the ReLu transfer function, which will help stop issues such as a vanishing gradient."
- Q: "What are some practical constraints of AI?"  
A: "Training AI models can require a large amount of computing power, also large datasets are needed for training models to a high accuracy which can be hard to obtain."
- Q: "What would you say increases the computing power required the most?"  
A: "The number of layers and neurons in each layer will have the greatest effect on the computing power required. This is another reason why I recommend adding the ReLu transfer function as it updates the values of the weights and biases faster than the Sigmoid transfer function."
- Q: "Do you think I should explore other computer architectures for training the models?"  
A: "Yes, it would be great to add support for using graphics cards for training models, as this would be a vast improvement in training time compared to using just CPU power."
- Q: "I am also creating a user interface for the program, what hyper-parameters would you like to be able to control through this?"  
A: "It would be nice to control the transfer functions used, as well as the general hyper-parameters of the model. I also think you could add a progress tracker to be displayed during training for the user."

- Q:”How do you think I should measure the performance of models?”

A:”You should show the accuracy of the model’s predictions, as well as example incorrect and correct prediction results for the trained model. Additionally, you could compare how the size of the training dataset effects the performance of the model after training, to see if a larger dataset would seem beneficial.”

- Q:”Are there any other features you would like add?”

A:”Yes, it would be nice to be able to save a model after training and have the option to load in a trained model for testing.”

### 1.3 Project Objectives

Objective ID	Description
1	Learn how Artificial Neural Networks work and develop them from first principles
2	Implement the Artificial Neural Networks by creating trained models on image datasets
2.1	Allow use of Graphics Cards for faster training
2.2	Allow for the saving and loading of trained models
3	Develop a Graphical User Interface
3.1	Provide controls for hyper-parameters of models
3.2	Display and compare the results each model’s predictions

### 1.4 Requirements

The following sets out the steps that must be taken to accomplish the above objectives:

ID	Description	Satisfied by	Tested by
1	Learn how Artificial Neural Networks work	Page 5	N/A
2	Develop Artificial Neural Networks from first principles		
2.1	Provide utilities for creating Artificial Neural Networks	Page 32	Page 100
2.2	Allow for the saving and loading of trained models' weights and biases	Page 36	Page 100
2.3	Allow use of Graphics Cards for faster training	Code not included in report	Page 95
3	Implement the Artificial Neural Networks on image datasets		
3.1	Allow input of unique hyper-parameters	Page 43	Page 77
3.2	Allow unique datasets and train dataset size to be loaded	Page 43	Page 84
4	Use a database to store a model's features and the location of its weights and biases	Page 59	TODO Unit Test
5	Develop a Graphical User Interface		
5.1	Provide controls for hyper-parameters of models	Page 48	Page 96
5.2	Display details of models' training	Page 48	N/A
5.3	Display the results of each model's predictions	Page 68	User Tested
5.4	Allow for the saving of trained models	Page 68	Page 99
5.5	Allow for the loading of saved trained models	Page 55	Page 98

## 1.5 Theory behind Artificial Neural Networks

From an abstract perspective, Artificial Neural Networks are inspired by how the human mind works, by consisting of layers of 'neurons' all interconnected via different links, each with their own strength. By adjusting these links, Artificial Neural Networks can be trained to take in an input and give its best prediction as an output.

### 1.5.1 Structure

I have focused on Feed-Forward Artificial Neural Networks, where values are entered to the input layer and passed forwards repetitively to the next layer until reaching the output layer. Within this, I have learnt two types of Feed-Forward Artificial Neural Networks: Perceptron Artificial Neural Networks, that contain no hidden layers and are best at learning more linear patterns and Multi-Layer Perceptron Artificial Neural Networks, that contain at least one hidden layer, as a result increasing the non-linearity in the Artificial Neural Network and allowing it to learn more complex / non-linear problems.

Multi-Layer Perceptron Artificial Neural Networks consist of:

- An input layer of input neurons, where the input values are entered.
- Hidden layers of hidden neurons.
- An output layer of output neurons, which outputs the final prediction.

Figure 1: This shows an Artificial Neural Network with one single hidden layer and is known as a Shallow Neural Network.

To implement an Artificial Neural Network, matrices are used to represent the layers, where each layer is a matrix of the layer's neuron's values. In order to use matrices for this, the following basic theory must be known about them:

- When Adding two matrices, both matrices must have the same number of rows and columns. Or one of the matrices can have the same number of rows but only one column, then be added by element-wise addition where each element is added to all of the elements of the other matrix in the same row.
- In order to multiply matrices, I take the 'dot product' of the matrices, which multiplies the row of one matrix with the column of the other, by multiplying matching members and then summing up.
- When taking the dot product of two matrices, the number of columns of the 1st matrix must equal the number of rows of the 2nd matrix. And the result will have the same number of rows as the 1st matrix, and the same number of columns as the 2nd matrix. This is important, as the output of one layer must be formatted correctly to be used with the next layer.
- Alternatively, at times I take the Hadamard product of two matrices which performs element-wise multiplication of the matrices. For this, both matrices must have the same number of rows and columns.
- Transposing a matrix will turn all rows of the matrix into columns and all columns into rows.
- A matrix of values can be classified as a rank of Tensors, depending on the number of dimensions of the matrix. (Eg: A 2-dimensional matrix is a Tensor of rank 2)

I have focused on just using Fully-Connected layers, that will take in input values and apply the following calculations to produce an output of the layer:

- An Activation function

- This calculates the dot product of the input matrix with a weight matrix, then sums the result with a bias matrix
- A Transfer function
  - This takes the result of the Activation function and transfers it to a suitable output value as well as adding more non-linearity to the Neural Network.
  - For example, the Sigmoid Transfer function converts the input to a number between zero and one, making it useful for logistic regression where the output value can be considered as closer to zero or one allowing for a binary classification of predicting zero or one.

### 1.5.2 How Artificial Neural Networks learn

To train an Artificial Neural Network, the following processes will be carried out for each of a number of training epochs:

- Forward Propagation:
  - The process of feeding inputs in and getting a prediction (moving forward through the network)
- Back Propagation:
  - The process of calculating the Loss in the prediction and then adjusting the weights and biases accordingly
  - I have used Supervised Learning to train the Artificial Neural Networks, where the output prediction of the Artificial Neural Network is compared to the values it should have predicted. With this, I can calculate the Loss value of the prediction (how wrong the prediction is from the actual value).
  - I then move back through the network and update the weights and biases via Gradient Descent:
    - \* Gradient Descent aims to reduce the Loss value of the prediction to a minimum, by subtracting the rate of change of Loss with respect to the weights/ biases, multiplied with a learning rate, from the weights/biases.
    - \* To calculate the rate of change of Loss with respect to the weights/biases, you must use the following calculus methods:
      - Partial Differentiation, in order to differentiate the multi-variable functions, by taking respect to one variable and treating the rest as constants.
      - The Chain Rule, where for  $y = f(u)$  and  $u = g(x)$ ,  $\frac{\partial y}{\partial u} * \frac{\partial u}{\partial x} =$
      - For a matrix of  $f(x)$  values, the matrix of  $\frac{\partial f(x)}{\partial x}$  values is known as the Jacobian matrix

- \* This repetitive process will continue to reduce the Loss to a minimum, if the learning rate is set to an appropriate value

Figure 2: Gradient Descent  
sourced from <https://www.ibm.com/topics/gradient-descent>

- \* However, during backpropagation some issues can occur, such as the following:
  - Finding a false local minimum rather than the global minimum of the function
  - Having an 'Exploding Gradient', where the gradient value grows exponentially to the point of overflow errors
  - Having a 'Vanishing Gradient', where the gradient value decreases to a very small value or zero, resulting in a lack of updating values during training.

## 1.6 Theory Behind Deep Artificial Neural Networks

### 1.6.1 Setup

- Where a layer takes the previous layer's output as its input  $X$
- Then it applies an Activation function to  $X$  to obtain  $Z$ , by taking the dot product of  $X$  with a weight matrix  $W$ , then sums the result with a bias matrix  $B$ . At first the weights are initialised to random values and the biases are set to zeros.

$$- Z = W * X + B$$

- Then it applies a Transfer function to  $Z$  to obtain the layer's output

Figure 3: This shows an abstracted view of an Artificial Neural Network with multiple hidden layers and is known as a Deep Neural Network.

- For the output layer, the sigmoid function (explained previously) must be used for either for binary classification via logistic regression, or for multi- class classification where it predicts the output neuron, and the associated class, that has the highest value between zero and one.
  - \* Where  $\text{sigmoid}(Z) = \frac{1}{1+e^{-Z}}$
- However, for the input layer and the hidden layers, another transfer function known as ReLu (Rectified Linear Unit) can be better suited as it produces larger values of  $\frac{\partial L}{\partial W}$  and  $\frac{\partial L}{\partial B}$  for Gradient Descent than Sigmoid, so updates at a quicker rate.
  - \* Where  $\text{relu}(Z) = \max(0, Z)$

### 1.6.2 Forward Propagation:

- For each epoch the input layer is given a matrix of input values, which are fed through the network to obtain a final prediction A from the output layer.

### 1.6.3 Back Propagation:

- First the Loss value L is calculated using the following Log-Loss function, which calculates the average difference between A and the value it should have predicted Y. Then the average is found by summing the result of the Loss function for each value in the matrix A, then dividing by the number of predictions m, resulting in a Loss value to show how well the network is performing.
  - Where  $L = -(\frac{1}{m}) * \sum(Y * \log(A) + (1 - Y) * \log(1 - A))$  and "log()" is the natural logarithm
- I then move back through the network, adjusting the weights and biases via Gradient Descent. For each layer, the weights and biases are updated with the following formulae:
  - $W = W - \text{learningRate} * \frac{\partial L}{\partial W}$
  - $B = B - \text{learningRate} * \frac{\partial L}{\partial B}$

- The derivation for Layer 2's  $\frac{\partial L}{\partial W}$  and  $\frac{\partial L}{\partial B}$  can be seen below:
  - Functions used so far:
    1.  $Z = W * X + B$
    2.  $A_{relu} = \max(0, Z)$
    3.  $A_{sigmoid} = \frac{1}{1+e^{-Z}}$
    4.  $L = -(\frac{1}{m}) * \sum(Y * \log(A) + (1 - Y) * \log(1 - A))$
  - $\frac{\partial L}{\partial A2} = \frac{\partial L}{\partial A3} * \frac{\partial A3}{\partial Z3} * \frac{\partial Z3}{\partial A2}$   
 By using function 1, where A2 is X for the 3rd layer,  $\frac{\partial Z3}{\partial A2} = W3$   
 $\Rightarrow \frac{\partial L}{\partial A2} = \frac{\partial L}{\partial A3} * \frac{\partial A3}{\partial Z3} * W3$
  - $\frac{\partial L}{\partial W2} = \frac{\partial L}{\partial A2} * \frac{\partial A2}{\partial Z2} * \frac{\partial Z2}{\partial W2}$   
 By using function 1, where A1 is X for the 2nd layer,  $\frac{\partial Z2}{\partial W2} = A1$   
 $\Rightarrow \frac{\partial L}{\partial W2} = \frac{\partial L}{\partial A2} * \frac{\partial A2}{\partial Z2} * A1$
  - $\frac{\partial L}{\partial B2} = \frac{\partial L}{\partial A2} * \frac{\partial A2}{\partial Z2} * \frac{\partial Z2}{\partial B2}$   
 By using function 1,  $\frac{\partial Z2}{\partial B2} = 1$   
 $\Rightarrow \frac{\partial L}{\partial B2} = \frac{\partial L}{\partial A2} * \frac{\partial A2}{\partial Z2} * 1$
- As you can see, when moving back through the network, the  $\frac{\partial L}{\partial W}$  and  $\frac{\partial L}{\partial B}$  of the layer can be calculated with the rate of change of loss with respect to its output, which is calculated by the previous layer using the above formula; the derivative of the layer's transfer function, and the layers input (which in this case is A1)
  - Where by using function 2,  $\frac{\partial A_{relu}}{\partial Z} = 1$  when  $Z \geq 0$  otherwise  $\frac{\partial A_{relu}}{\partial Z} = 0$
  - Where by using function 3,  $\frac{\partial A_{sigmoid}}{\partial Z} = A * (1 - A)$
- At the start of backpropagation, the rate of change of loss with respect to the output layer's output has no previous layer's calculations, so instead it can be found with the derivative of the Log-Loss function, as shown in the following:
  - Using function 4,  $\frac{\partial L}{\partial A} = (-\frac{1}{m})(\frac{Y-A}{A*(1-A)})$

## 1.7 Theory behind training the Artificial Neural Networks

Training an Artificial Neural Network's weights and biases to predict on a dataset, will create a trained model for that dataset, so that it can predict on future images inputted. However, training Artificial Neural Networks can involve some problems such as Overfitting, where the trained model learns the patterns of the training dataset too well, causing worse prediction on a different test dataset. This can occur when the training dataset does not cover enough situations of inputs and the desired outputs (by being too small for example), if the model is trained for too many epochs on the poor dataset and having too many layers in the Neural Network. Another problem is Underfitting, where the model has not learnt the patterns of the training dataset well enough, often when it has been trained for too few epochs, or when the Neural Network is too simple (too linear).

### 1.7.1 Datasets

- MNIST dataset
  - The MNIST dataset is a famous dataset of images of handwritten digits from zero to ten and is commonly used to test the performance of an Artificial Neural Network.
  - The dataset consists of 60,000 input images, made up from 28x28 pixels and each pixel has an RGB value from 0 to 255
  - To format the images into a suitable format to be inputted into the Artificial Neural Networks, each image's matrix of RGB values are 'flattened' into a 1 dimensional matrix of values, where each element is also divided by 255 (the max RGB value) to a number between 0 and 1, to standardize the dataset.
  - The output dataset is also loaded, where each output for each image is an array, where the index represents the number of the image, by having a 1 in the index that matches the number represented and zeros for all other indexes.
  - To create a trained Artificial Neural Network model on this dataset, the model will require 10 output neurons (one for each digit), then by using the Sigmoid Transfer function to output a number between one and zero to each neuron, whichever neuron has the highest value is predicted. This is multi-class classification, where the model must predict one of 10 classes (in this case, each class is one of the digits from zero to ten).
- Cat dataset
  - I will also use a dataset of images sourced from <https://github.com/marcopeix>, where each image is either a cat or not a cat.
  - The dataset consists of 209 input images, made up from 64x64 pixels and each pixel has an RGB value from 0 to 255
  - To format the images into a suitable format to be inputted into the Artificial Neural Networks, each image's matrix of RGB values are 'flattened' into a 1 dimensional array of values, where each element is also divided by 255 (the max RGB value) to a number between 0 and 1, to standardize the dataset.
  - The output dataset is also loaded, and is reshaped into a 1 dimensional array of 1s and 0s, to store the output of each image (1 for cat, 0 for non cat)
  - To create a trained Artificial Neural Network model on this dataset, the model will require only 1 output neuron, then by using the Sigmoid Transfer function to output a number between one and zero for the neuron, if the neuron's value is closer to 1 it predicts cat, otherwise it predicts not a cat. This is binary classification, where the model must use logistic regression to predict whether it is a cat or not a cat.

- XOR dataset
  - For experimenting with Artificial Neural Networks, I solve the XOR gate problem, where the Neural Network is fed input pairs of zeros and ones and learns to predict the output of a XOR gate used in circuits.
  - This takes much less computation time than image datasets, so is useful for quickly comparing different hyper-parameters of a Network, whilst still not being linearly separable.

### **1.7.2 Theory behind using Graphics Cards to train Artificial Neural Networks**

Graphics Cards consist of many Tensor cores which are processing units specialised for matrix operations for calculating the co-ordinates of 3D graphics, however they can be used here for operating on the matrices in the network at a much faster speed compared to CPUs. GPUs also include CUDA cores which act as an API to the GPU's computing to be used for any operations (in this case training the Artificial Neural Networks).

## 2 Design

### 2.1 Introduction

The following design focuses have been made for the project:

- The program will support multiple platforms to run on, including Windows and Linux.
- The program will use python3 as its main programming language.
- I will take an object-orientated approach to the project.
- I will give an option to use either a Graphics Card or a CPU to train and test the Artificial Neural Networks.

I will also be using SysML for designing the following diagrams.

### 2.2 System Architecture

bdd [block] School Project Frame [System Architecture Diagram]

## 2.3 Class Diagrams

### 2.3.1 UI Class Diagram

bdd [package] School Project [UI Class Diagram]

### 2.3.2 Model Class Diagram

bdd [package] School Project [Model Class Diagram]

## 2.4 System Flow chart

act [activity] System Flow chart [System Flow chart]

## 2.5 Algorithms

Refer to Analysis for the algorithms behind the Artificial Neural Networks.

## 2.6 Data Structures

I will use the following data structures in the program:

- Standard lists for storing data, for example storing the shape of the Artificial Neural Network's layers.
- Tuples where tuple unpacking is useful, such as returning multiple values from methods.
- Dictionaries for loading the default hyper-parameter values from a JSON file.
- Matrices to represent the layers and allow for a varied number of neurons in each layer. To represent the Matrices I will use both numpy arrays and cupy arrays.
- A Doubly linked list to represent the Artificial Neural Network, where each node is a layer of the network. This will allow me to traverse both forwards and backwards through the network, as well as storing the first and last layer to start forward and backward propagation respectively.

## 2.7 File Structure

I will use the following file structures to store necessary data for the program:

- A JSON file for storing the default hyper-parameters for creating a new model for each dataset.
- I will store the image dataset files in a 'datasets' directory. The dataset files will either be a compressed archive file (such as .pkl.gz files) or of the Hierarchical Data Format (such as .h5) for storing large datasets with fast retrieval.
- I will save the weights and biases of saved models as numpy arrays in .npz files (a zipped archive file format) in a 'saved-models' directory, due to their compatibility with the numpy library.

## 2.8 Database Design

I will use the following Relational database design for saving models, where the dataset, name and features of the saved model (including the location of the saved models' weights and biases and the saved models' hyper-parameters) are saved:

Models	
Model_ID	integer
Dataset	text
File_Location	text
Hidden_Layers_Shape	text
Learning_Rate	float
Name	text
Train_Dataset_Size	integer
Use_ReLu	bool

- I will also use the following unique constraint, so that each dataset can not have more than one model with the same name:

```
UNIQUE (Dataset, Name)
```

## 2.9 Queries

Here are some example queries for interacting with the database:

- I can query the names of all saved models for a dataset with:

```
SELECT Name FROM Models WHERE Dataset=?;
```

- I can query the file location of a saved model with:

```
SELECT File_Location FROM Models WHERE Dataset=? AND Name=?;
```

- I can query the features of a saved model with:

```
SELECT * FROM Models WHERE Dataset=? AND Name=;
```

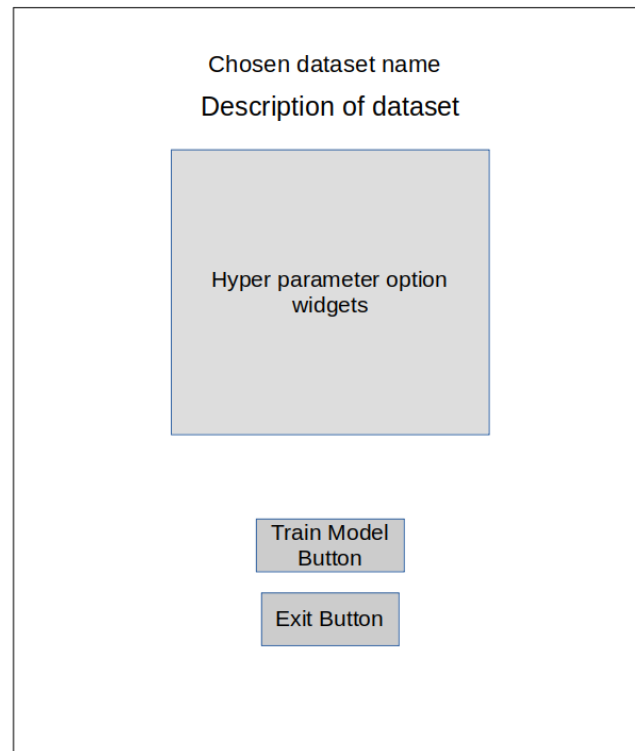

## 2.10 Human-Computer Interaction

Here are the designs of each tkinter frame in the User Interface:

- Home Frame design:

- Hyper-Parameter Frame design:

- Training Frame design:
  - During training, the following is displayed on the Training Frame:

- Once training has finished, the following is displayed on the Training Frame:

- Load Model Frame design:

- Test Frame design:

Testing Results:  
Prediction Accuracy: x %  
Network Shape: y

Example Results

Enter a name for your trained model:

Text Entry for  
model name

Save Model  
Button

Exit Button

## 2.11 Hardware Design

To allow for faster training of an Artificial Neural Network, I will give the option to use a Graphics Card to train the Artificial Neural Network if available. I will also give the option to load pretrained weights to run on less computationally powerful hardware using just the CPU as standard.

## 2.12 Workflow and source control

I will use Git along with GitHub to manage my workflow and source control as I develop the project, by utilising the following features:

- Commits and branches for adding features and fixing bugs separately.
- Using GitHub to back up the project as a repository.
- I will setup automated testing on GitHub after each pushed commit.
- I will also provide the necessary instructions and information for the installation and usage of this project, aswell as creating releases of the project with new patches.

## 3 Technical Solution TODO

### 3.1 Setup

#### 3.1.1 File Structure

I used the following file structure to organise the code for the project, where `school_project` is the main package and is constructed of two main subpackages:

- The `models` package, which is a self-contained package for creating trained Artificial Neural Network models.
- The `frames` package, which consists of tkinter frames for the User Interface.

```

18 directories, 49 files

Each package within the school\_project package contains a `__init__.py` file, which allows the school\_project package to be installed to a virtual environment so that the modules of the package can be imported from the installed package.

- Here is the contents of the frames package's `__init__.py` for example, which allows the classes of all modules in the package to be imported at once:

---

```
1  """Package of tkinter frames for the main window."""
2
3  from .create_model import HyperParameterFrame, TrainingFrame
4  from .load_model import LoadModelFrame
5  from .test_model import TestMNISTFrame, TestCatRecognitionFrame,
   ↪ TestXORFrame
6
7  __all__ = ['create_model', 'load_model', 'test_model']
```

---

I have omitted the source code for this report, which included a Makefile for its compilation.

### 3.1.2 Dependencies

The python dependencies for the project can be installed simply by running the following `setup.py` file (as described in the README.md in the next section). Instructions on installing external dependencies, such as the CUDA Toolkit for using a GPU, are explained in the README.md in the next section also.

- `setup.py` code:

---

```
1  from setuptools import setup, find_packages
2
3  setup(
4      name='school-project',
5      version='1.0.0',
6      packages=find_packages(),
7      url='https://github.com/mcttn22/school-project.git',
8      author='Max Cotton',
9      author_email='maxcotton22@gmail.com',
10     description='Year 13 Computer Science Programming Project',
11     install_requires=[
12         'cupy-cuda12x',
13         'h5py',
14         'matplotlib',
15         'numpy',
16         'pympler'
17     ],
18 )
```

---

### 3.1.3 Git and Github files

To optimise the use of Git and GitHub, I have used the following files:

- A `.gitignore` file for specifying which files and directories should be ignored by Git:

---

```

1 # Byte compiled files
2 __pycache__/_
3
4 # Packaging
5 *.egg-info
6
7 # Database file
8 school_project/saved_models.db

```

---

- A README.md markdown file to give installation and usage instructions for the repository on GitHub:

– Markdown code:

---

```

1 <!-- The following lines generate badges showing the current status of

5 # A-level Computer Science NEA Programming Project
6
7 This project is an investigation into how Artificial Neural Networks
   ↳ (ANNs) work and their applications in Image Recognition, by
   ↳ documenting all theory behind the project and developing
   ↳ applications of the theory, that allow for experimentation via a
   ↳ GUI. The ANNs are created without the use of any 3rd party Machine
   ↳ Learning Libraries and I currently have been able to achieve a
   ↳ prediction accuracy of 99.6% on the MNIST dataset. The report for
   ↳ this project is also included in this repository.
8
9 ## Installation
10
11 1. Download the Repository with:
12
13 - ```
14   git clone https://github.com/mcttn22/school-project.git
15   ```
16 - Or by downloading as a ZIP file
17
18 </br>
19
20 2. Create a virtual environment (venv) with:
21 - Windows:
22   ```
23   python -m venv {venv name}
24   ```
25 - Linux:
26   ```
27   python3 -m venv {venv name}
28   ```
29
30 3. Enter the venv with:
31 - Windows:
32   ```
33   .\{venv name}\Scripts\activate
34   ```
35 - Linux:
36   ```
37   source ./{venv name}/bin/activate
38   ```

```

```

39
40 4. Enter the project directory with:
41     ````
42     cd school-project/
43     ````
44
45 5. For normal use, install the dependencies and the project to the
46    ↪ venv with:
47    - Windows:
48        ````
49        python setup.py install
50        ````
51    - Linux:
52        ````
53        python3 setup.py install
54        ````
55
56 *Note: In order to use an Nvidia GPU for training the networks, the
57    ↪ latest Nvidia drivers must be installed and the CUDA Toolkit must
58    ↪ be installed from
59    <a href="https://developer.nvidia.com/cuda-downloads">here</a>.*
60
61 ## Usage
62
63 Run with:
64 - Windows:
65     ````
66     python school_project
67     ````
68 - Linux:
69     ````
70     python3 school_project
71     ````
72
73 ## Development
74
75 Install the dependencies and the project to the venv in developing
76    ↪ mode with:
77    - Windows:
78        ````
79        python setup.py develop
80        ````
81    - Linux:
82        ````
83        python3 setup.py develop
84        ````
85
86 Run Tests with:
87 - Windows:
88     ````
89     python -m unittest discover .\school_project\test\
90     ````
91 - Linux:
92     ````
93     python3 -m unittest discover ./school_project/test/
94     ````
95
96 Use Docker with:
97 - Build the Docker Image with:
98     ````
99     sudo docker build -t mcttn22/school-project ./
100     ````

```

```

97 - Run the Docker Image with:
98   ```
99   sudo apt-get install x11-xserver-utils
100  xhost +
101  sudo docker run -v /tmp/.X11-unix:/tmp/.X11-unix -e
    ↔ DISPLAY=unix$DISPLAY mcttn22/school-project
102  ```
103
104  Compile Project Report PDF with:
105  ```
106  make all
107  ```
108  *Note: This requires the Latexmk, pdflatex and Pygments libraries*

```

---

- Which will generate the following:

 Tests passing
 Python 3

## A-level Computer Science NEA Programming Project

This project is an investigation into how Artificial Neural Networks (ANNs) work and their applications in Image Recognition, by documenting all theory behind the project and developing applications of the theory, that allow for experimentation via a GUI. The ANNs are created without the use of any 3rd party Machine Learning Libraries and I currently have been able to achieve a prediction accuracy of 99.6% on the MNIST dataset. The report for this project is also included in this repository.

### Installation

1. Download the Repository with:

- `git clone https://github.com/mcttn22/school-project.git` 

- Or by downloading as a ZIP file

2. Create a virtual environment (venv) with:

- Windows:

```
python -m venv {venv name}
```

- Linux:

```
python3 -m venv {venv name}
```

3. Enter the venv with:

- Windows:

```
.\{venv name}\Scripts\activate
```

- Linux:

```
source ./{venv name}/bin/activate
```

4. Enter the project directory with:

```
cd school-project/
```

5. For normal use, install the dependencies and the project to the venv with:

- Windows:

```
python setup.py install
```

- Linux:

```
python3 setup.py install
```

*Note: In order to use an Nvidia GPU for training the networks, the latest Nvidia drivers must be installed and the CUDA Toolkit must be installed from [here](#).*

## Usage

Run with:

- Windows:

```
python school_project
```

- Linux:

```
python3 school_project
```

## Development

Install the dependencies and the project to the venv in developing mode with:

- Windows:

```
python setup.py develop
```

- Linux:

```
python3 setup.py develop
```

Run Tests with:

- Windows:

```
python -m unittest discover .\school_project\test\
```

- Linux:

```
python3 -m unittest discover ./school_project/test/
```

Use Docker with:

- Build the Docker Image with:

```
sudo docker build -t mcttn22/school-project ./
```

- Run the Docker Image with:

```
sudo apt-get install x11-xserver-utils
xhost +
sudo docker run -v /tmp/.X11-unix:/tmp/.X11-unix -e DISPLAY=unix$DISPLAY mcttn22/school-prc
```

Compile Project Report PDF with:

```
make all
```

*Note: This requires the Latexmk, pdflatex and Pygments libraries*

- A LICENSE file that describes how others can use my code.

#### 3.1.4 Organisation

I also utilise a TODO.md file for keeping track of what features and/or bugs need to be worked on.

### 3.2 models package

This package is a self-contained package for creating trained Artificial Neural Networks and can either be used for a CPU or a GPU, as well as containing the test and training data for all three datasets in a datasets directory. Whilst both the cpu and gpu subpackage are similar in functionality, the cpu subpackage uses NumPy for matrices whereas the gpu subpackage utilise NumPy and another library CuPy which requires a GPU to be utilised for operations with the matrices. For that reason it is only worth showing the code for the cpu subpackage.

Both the cpu and gpu subpackage contain a utils subpackage that provides the tools for creating Artificial Neural Networks, and three modules that are the implementation of Artificial Neural Networks for each dataset.

#### 3.2.1 utils subpackage

The utils subpackage consists of a tools.py module that provides a ModelInterface class and helper functions for the model.py module, that contains an AbstractModel class that implements every method from the ModelInterface except for the load\_dataset method.

- tools.py module:

---

```

1  """Helper functions and ModelInterface class for model module."""
2
3  from abc import ABC, abstractmethod
4
5  import numpy as np
6
7  class ModelInterface(ABC):
8      """Interface for ANN models."""
9      @abstractmethod
10     def _setup_layers(setup_values: callable) -> None:
11         """Decorator that sets up model layers and sets up values of each
↪ layer
12         with the method given.
13
14         Args:
15             setup_values (callable): the method that sets up the values of
↪ each
16             layer.
17         Raises:
18             NotImplementedError: if this method is not implemented.
19
20         """
21         raise NotImplementedError
22
23     @abstractmethod
24     def create_model_values(self) -> None:
25         """Create weights and bias/biases
26
27         Raises:
28             NotImplementedError: if this method is not implemented.
29
30         """
31         raise NotImplementedError
32
33     @abstractmethod
34     def load_model_values(self, file_location: str) -> None:
35         """Load weights and bias/biases from .npz file.
36
37         Args:
38             file_location (str): the location of the file to load from.
39         Raises:
40             NotImplementedError: if this method is not implemented.
41
42         """
43         raise NotImplementedError
44
45     @abstractmethod
46     def load_datasets(self, train_dataset_size: int) -> tuple[np.ndarray,
↪ np.ndarray,
47                                                                np.ndarray,
↪ np.ndarray]:
48         """Load input and output datasets. For the input dataset, each
↪ column
49         should represent a piece of data and each row should store the
↪ values
50         of the piece of data.
51
52         Args:
53             train_dataset_size (int): the number of train dataset inputs to
↪ use.

```

```

54         Returns:
55             tuple of train_inputs, train_outputs,
56             test_inputs and test_outputs.
57         Raises:
58             NotImplementedError: if this method is not implemented.
59
60         """
61         raise NotImplementedError
62
63     @abstractmethod
64     def back_propagation(self, prediction: np.ndarray) -> None:
65         """Adjust the weights and bias/biases via gradient descent.

### 3.3 frames package

I decided to use tkinter for the User Interface and the frames package consists of tkinter frames to be loaded onto the main window when needed. The package also includes a hyper-parameter-defaults.json file, which stores optimum default values for the hyper-parameters to be set to.

- hyper-parameter-defaults.json file contents:

```

1  {
2      "MNIST": {
3          "description": "An Image model trained on recognising numbers from
↪ images.",

```

```

4         "epochCount": 150,
5         "hiddenLayersShape": [1000, 1000],
6         "minTrainDatasetSize": 1,
7         "maxTrainDatasetSize": 60000,
8         "maxLearningRate": 1
9     },
10    "Cat Recognition": {
11        "description": "An Image model trained on recognising if an image
↪ is a cat or not.",
12        "epochCount": 3500,
13        "hiddenLayersShape": [100, 100],
14        "minTrainDatasetSize": 1,
15        "maxTrainDatasetSize": 209,
16        "maxLearningRate": 0.3
17    },
18    "XOR": {
19        "description": "For experimenting with Artificial Neural Networks,
↪ a XOR gate model has been used for its lesser computation time.",
20        "epochCount": 4700,
21        "hiddenLayersShape": [100, 100],
22        "minTrainDatasetSize": 2,
23        "maxTrainDatasetSize": 4,
24        "maxLearningRate": 1
25    }
26 }

```

---

## 4 Testing TODO

### 4.1 Investigation

#### 4.1.1 test\_model module

The test\_model module is contained within the frames package, and contains tkinter frames for testing the trained Artificial Neural Network models for each dataset. For each training dataset that an Artificial Neural Network is trained on, there is a corresponding test dataset with completely new images to be tested on to judge the performance of the trained model. As fewer images are needed for testing than for training, the Cat dataset only has 50 test images (compared to the 209 images for training) and the MNIST dataset only has 10,000 test images (compared to the 60,000 images for training). Each frame displays the results of the testing along with a random selection of incorrect and correct predictions.

```

---

Which outputs the following for the MNIST dataset:

And outputs the following for the Cat Recognition dataset:

And outputs the following for the XOR dataset:

#### 4.1.2 Effects of Hyper-Parameters

For the following investigations, I utilised Jupyter Notebook and have displayed the results below:

## Learning Rate Analysis

The following code trains and tests models on the XOR dataset with varying learning rates, and then plots graphs of Loss Value against Epoch Count.

```
[17]: import os

import matplotlib.pyplot as plt
import numpy as np

from school_project.models.cpu.xor import XORModel as Model

# Change to root directory of project
os.chdir(os.getcwd())

# Set width and height of figure
plt.rcParams["figure.figsize"] = [5, 10]

learning_rates = [0.01, 0.1, 1.0]

figure, axis = plt.subplots(nrows=len(learning_rates), ncols=1)

for count, learning_rate in enumerate(learning_rates):
    model = Model(hidden_layers_shape=[100, 100],
                  train_dataset_size=4,
                  learning_rate=learning_rate,
                  use_relu=True)
    model.create_model_values()
    model.train(epoch_count=4_700)
    model.test()

    axis[count].set_title(f"Learning Rate: {model.learning_rate}")
    axis[count].set_xlabel("Epoch Count")
    axis[count].set_ylabel("Loss Value")
    axis[count].plot(np.squeeze(model.train_losses))

plt.tight_layout()
plt.show()
```

As shown above, if the learning rate is set to too low of a value (0.01 in this case) the model will take more epochs to reduce the loss value, and may even get stuck in unwanted local minimums. If the learning rate is set to an optimal value (0.1 in this case) the model reduces the loss value efficiently and to a small enough value for predictions. On the other hand, if the learning rate is set to too high of a value (1.0 in this case) the model may learn too quickly and even ‘jump over’ minima, causing the loss value to stop reducing.

## Epoch Count Analysis

The following code trains models on the Cat Recognition dataset and tests the model at regular Epoch Count intervals, and then plots graphs of Test Prediction Accuracy against Epoch Count and Training Time against Epoch Count.

```
[6]: from IPython.display import clear_output, display
import os

import matplotlib.pyplot as plt
import numpy as np

from school_project.models.gpu.cat_recognition import CatRecognitionModel as Model

# Change to root directory of project
os.chdir(os.getcwd())

# Set width and height of figure
plt.rcParams["figure.figsize"] = [10, 5]

# Generate list of Epoch Counts from 1 to 5000, incremented by 500
epoch_count_interval = 500
epoch_counts = np.array(list(range(0, 5_000, epoch_count_interval)))

test_prediction_accuracies = np.array([])
training_times = np.array([])

# Create model object
model = Model(hidden_layers_shape=[100, 100],
               train_dataset_size=209,
               learning_rate=0.1,
               use_relu=True)
model.create_model_values()

for index, epoch_count in enumerate(epoch_counts):
    clear_output(wait=True)
    display(f"Progress: {round(number=index/len(epoch_counts) * 100, ndigits=2)}%")
```

```

model.train(epoch_count=epoch_count_interval)
model.test()

test_prediction_accuracies = np.append(test_prediction_accuracies,
                                       model.test_prediction_accuracy)

# Add training times cumulatively
if len(training_times) != 0:
    training_times = np.append(training_times,
                              training_times[-1] + model.training_time)
else:
    training_times = np.append(training_times,
                              model.training_time)

clear_output(wait=True)
display("Progress: Complete")

figure, axis = plt.subplots(nrows=1, ncols=2)

axis[0].set_xlabel("Epoch Count")
axis[0].set_ylabel("Test Prediction Accuracy (%)")

# Plot regression line
axis[0].plot(epoch_counts, test_prediction_accuracies, marker='x')

# Determine gradient and y-intercept of training times regression line
m, c = np.polyfit(epoch_counts, training_times, deg=1)
print(f"Training Times Regression Line Gradient: {round(number=m, ndigits=2)}")

axis[1].set_xlabel("Epoch Count")
axis[1].set_ylabel("Training Time (s)")

# Plot scatter graph of epoch counts and training times
axis[1].scatter(epoch_counts, training_times, marker='x')

# Plot regression line
axis[1].plot(epoch_counts, m * epoch_counts + c)

plt.tight_layout()
plt.show()

```

'Progress: Complete'

Training Times Regression Line Gradient: 0.01

As shown above, as the epoch count increases so does both the test prediction accuracy and the training time taken.

## Train Dataset Size Analysis

The following code trains and tests models on the Cat Recognition dataset with varying Train Dataset Sizes, and then plots graphs of Test Prediction Accuracy against Train Dataset Size and Training Time against Train Dataset Size.

```
[1]: from IPython.display import clear_output, display
import os

import matplotlib.pyplot as plt
import numpy as np

from school_project.models.gpu.cat_recognition import CatRecognitionModel as Model

# Change to root directory of project
os.chdir(os.getcwd())

# Set width and height of figure
plt.rcParams["figure.figsize"] = [10, 5]

# Generate list of train dataset sizes from 1 to 210, incremented by 13
train_dataset_sizes = np.array(list(range(1, 210, 13)))

test_prediction accuracies = np.array([])
training_times = np.array([])

for index, train_dataset_size in enumerate(train_dataset_sizes):
    clear_output(wait=True)
    display(f"Progress: {round(number=index/len(train_dataset_sizes) * 100, ndigits=2)}%")

    model = Model(hidden_layers_shape=[100, 100],
                   train_dataset_size=train_dataset_size,
                   learning_rate=0.1,
                   use_relu=True)
    model.create_model_values()
    model.train(epoch_count=2_000)
    model.test()
```

```

test_prediction_accuracies = np.append(test_prediction_accuracies,
                                       model.test_prediction_accuracy)
training_times = np.append(training_times,
                           model.training_time)

clear_output(wait=True)
display("Progress: Complete")

figure, axis = plt.subplots(nrows=1, ncols=2)

# Determine gradient and y-intercept of prediction accuracies regression line
m, c = np.polyfit(train_dataset_sizes, test_prediction_accuracies, deg=1)
print(f"Test Prediction Accuracies Regression Line Gradient: {round(number=m, ndigits=2)}")

axis[0].set_xlabel("Train Dataset Size")
axis[0].set_ylabel("Test Prediction Accuracy (%)")

# Plot scatter graph of train dataset sizes and prediction accuracies
axis[0].scatter(train_dataset_sizes, test_prediction_accuracies, marker='x')

axis[0].plot(train_dataset_sizes, m * train_dataset_sizes + c)

# Determine gradient and y-intercept of training times regression line
m, c = np.polyfit(train_dataset_sizes, training_times, deg=1)
print(f"Training Times Regression Line Gradient: {round(number=m, ndigits=2)}")

axis[1].set_xlabel("Train Dataset Size")
axis[1].set_ylabel("Training Time (s)")

# Plot scatter graph of train dataset sizes and training times
axis[1].scatter(train_dataset_sizes, training_times, marker='x')

# Plot regression line
axis[1].plot(train_dataset_sizes, m * train_dataset_sizes + c)

plt.tight_layout()
plt.show()

```

'Progress: Complete'

Test Prediction Accuracies Regression Line Gradient: 0.18

Training Times Regression Line Gradient: 0.08

As shown above, as the train dataset size increases do does both the prediction accuracy and the training time taken. Therefore, I can predict that if I increase the size of the Cat Recognition dataset, I could improve the accuracy of the model trained on the dataset.

## Layer Count Analysis

The following code trains and tests models on the Cat Recognition dataset with a varying number of layers, and then plots graphs of Test Prediction Accuracy against Layer Count and Training Time against Layer Count.

```
[1]: from IPython.display import clear_output, display
import os

import matplotlib.pyplot as plt
import numpy as np

from school_project.models.gpu.cat_recognition import CatRecognitionModel as Model

# Change to root directory of project
os.chdir(os.getcwd())

# Set width and height of figure
plt.rcParams["figure.figsize"] = [10, 5]

layer_counts = np.array(list(range(1, 5)))
neuron_count = 100
test_prediction accuracies = np.array([])
training_times = np.array([])

for index, layer_count in enumerate(layer_counts):
    clear_output(wait=True)
    display(f"Progress: {round(number=index/len(layer_counts) * 100, ndigits=2)}%")

    model = Model(
        hidden_layers_shape=[neuron_count for layer in range(layer_count)],
        train_dataset_size=209,
        learning_rate=0.1,
        use_relu=True
    )
    model.create_model_values()
    model.train(epoch_count=3_500)
    model.test()
```

```

test_prediction_accuracies = np.append(test_prediction_accuracies,
                                       model.test_prediction_accuracy)
training_times = np.append(training_times,
                           model.training_time)

clear_output(wait=True)
display("Progress: Complete")

figure, axis = plt.subplots(nrows=1, ncols=2)

axis[0].set_xlabel("Layer Count")
axis[0].set_ylabel("Test Prediction Accuracy (%)")

axis[0].plot(layer_counts, test_prediction_accuracies, marker='x')

# Determine gradient and y-intercept of training times regression line
m, c = np.polyfit(layer_counts, training_times, deg=1)
print(f"Training Times Regression Line Gradient: {round(number=m, ndigits=2)}")

axis[1].set_xlabel("Layer Count")
axis[1].set_ylabel("Training Time (s)")

# Plot scatter graph of layer Counts and training times
axis[1].scatter(layer_counts, training_times, marker='x')

# Plot regression line
axis[1].plot(layer_counts, m * layer_counts + c)

plt.tight_layout()
plt.show()

```

'Progress: Complete'

Training Times Regression Line Gradient: 3.03

As shown above, as the layer count increases so does the training time taken and the test prediction accuracy at first. However, as the layer count continued to increase the prediction accuracy began to drop greatly (after 2 layers in this case). This is most likely due to the model overfitting and learning the training dataset too closely, causing it to fail on the new inputs of the test dataset.

## Neuron Count Analysis

The following code trains and tests models on the Cat Recognition dataset with a varying number of neurons in each layer, and then plots graphs of Test Prediction Accuracy against Neuron Count and Training Time against Neuron Count.

```
[1]: from IPython.display import clear_output, display
import os

import matplotlib.pyplot as plt
import numpy as np

from school_project.models.gpu.cat_recognition import CatRecognitionModel as Model

# Change to root directory of project
os.chdir(os.getcwd())

# Set width and height of figure
plt.rcParams["figure.figsize"] = [10, 5]

# Generate list of neuron counts from 1 to 501, incremented by 100
neuron_counts = np.array(list(range(1, 501, 100)))

layer_count = 2
test_prediction accuracies = np.array([])
training_times = np.array([])

for index, neuron_count in enumerate(neuron_counts):
    clear_output(wait=True)
    display(f"Progress: {round(number=index/len(neuron_counts) * 100, ndigits=2)}%")

    model = Model(
        hidden_layers_shape=[neuron_count for layer in range(layer_count)],
        train_dataset_size=209,
        learning_rate=0.1,
        use_relu=True
    )
    model.create_model_values()
```

```

model.train(epoch_count=3_500)
model.test()

test_prediction_accuracies = np.append(test_prediction_accuracies,
                                         model.test_prediction_accuracy)
training_times = np.append(training_times,
                             model.training_time)

clear_output(wait=True)
display("Progress: Complete")

figure, axis = plt.subplots(nrows=1, ncols=2)

axis[0].set_xlabel("Neuron Count")
axis[0].set_ylabel("Test Prediction Accuracy (%)")

axis[0].plot(neuron_counts, test_prediction_accuracies, marker='x')

# Determine gradient and y-intercept of training times regression line
m, c = np.polyfit(neuron_counts, training_times, deg=1)
print(f"Training Times Regression Line Gradient: {round(number=m, ndigits=2)}")

axis[1].set_xlabel("Neuron Count")
axis[1].set_ylabel("Training Time (s)")

# Plot scatter graph of neuron counts and training times
axis[1].scatter(neuron_counts, training_times, marker='x')

# Plot regression line
axis[1].plot(neuron_counts, m * neuron_counts + c)

plt.tight_layout()
plt.show()

```

'Progress: Complete'

Training Times Regression Line Gradient: 0.31

As shown above, as the neuron count of each layer increases so does the training time taken and the test prediction accuracy at first. However, as the neuron count continued to increase the prediction accuracy began to drop greatly (after 200 neurons in this case). This is most likely due to the model overfitting and learning the training dataset too closely, causing it to fail on the new inputs of the test dataset.

## ReLu Analysis

The following code trains and tests models on the XOR dataset using ReLu and then not using ReLu, and then plots graphs of Loss Value against Epoch Count.

```
[1]: import os

import matplotlib.pyplot as plt
import numpy as np

from school_project.models.cpu.xor import XORModel as Model

# Change to root directory of project
os.chdir(os.getcwd())

# Set width and height of figure
plt.rcParams["figure.figsize"] = [10, 5]

figure, axis = plt.subplots(nrows=1, ncols=2)

model = Model(hidden_layers_shape=[100, 100],
               train_dataset_size=4,
               learning_rate=0.1,
               use_relu=True)
model.create_model_values()
model.train(epoch_count=4_700)
model.test()

axis[0].set_title("Use ReLu: True")
axis[0].set_xlabel("Epoch Count")
axis[0].set_ylabel("Loss Value")
axis[0].plot(np.squeeze(model.train_losses))

model = Model(hidden_layers_shape=[100, 100],
               train_dataset_size=4,
               learning_rate=0.1,
               use_relu=False)
model.create_model_values()
model.train(epoch_count=4_700)
model.test()
```

```

axis[1].set_title("Use ReLu: False")
axis[1].set_xlabel("Epoch Count")
axis[1].set_ylabel("Loss Value")
axis[1].plot(np.squeeze(model.train_losses))

plt.tight_layout()
plt.show()

```

As shown above, when using the ReLu transfer function along with the Sigmoid transfer function, the loss value decreases at a much faster rate than without. The model without the ReLu transfer function does reach the same accuracy but takes far more training epochs to do so.

## CPU vs GPU Analysis

The following code trains a model on the XOR dataset using the CPU and then using the GPU to train, and then outputs the training time taken.

```
[2]: import os

from school_project.models.cpu.cat_recognition import CatRecognitionModel as CPUModel
from school_project.models.gpu.cat_recognition import CatRecognitionModel as GPUModel

# Change to root directory of project
os.chdir(os.getcwd())

model = CPUModel(hidden_layers_shape=[100, 100],
                  train_dataset_size=209,
                  learning_rate=0.1,
                  use_relu=True)
model.create_model_values()
model.train(epoch_count=3_500)

print(f"CPU Training Time: {model.training_time}")

model = GPUModel(hidden_layers_shape=[100, 100],
                  train_dataset_size=209,
                  learning_rate=0.1,
                  use_relu=True)
model.create_model_values()
model.train(epoch_count=3_500)

print(f"GPU Training Time: {model.training_time}")
```

CPU Training Time: 160.45

GPU Training Time: 42.58

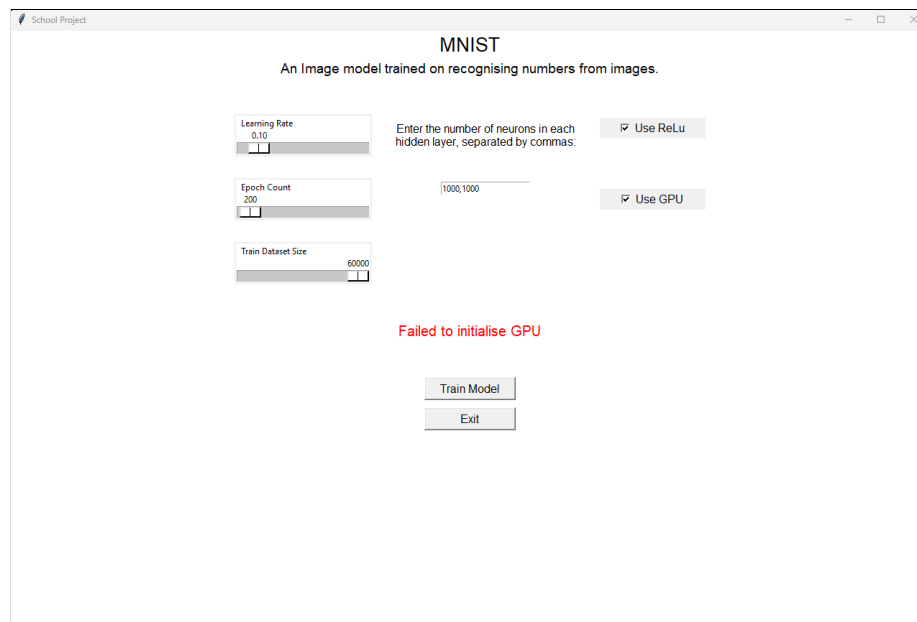

As shown above, the GPU is almost four times faster at training the model than the CPU, showing how beneficial it is to utilise the parallel computations of the GPU

## 4.2 Manual Testing

### 4.2.1 Input Validation Testing TODO

The following tests check the input validation of each frames' inputs.

- Hyper Parameter Frame:
  - Use GPU Validation:
    - \* Description: Select Use GPU checkbox without a GPU present.
    - \* Expected Result: The exception should be handled and a useful error message should be displayed.
    - \* Actual Result: Expected Result
    - \* Test Status: Pass
    - \* Evidence:

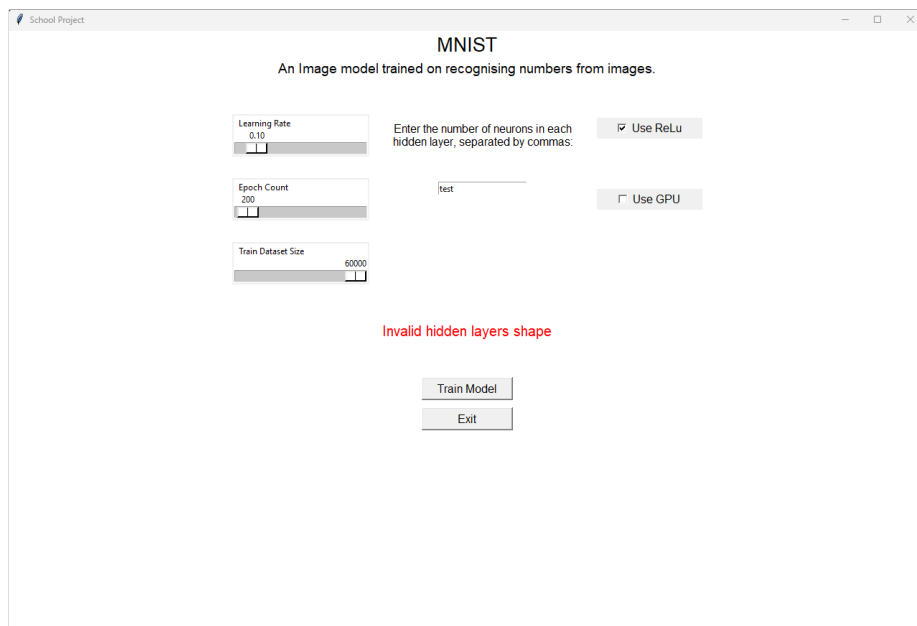

Link to video evidence: <https://github.com/mcttn22/school-project/blob/main/project-report/input-validation-testing-videos.md/#use-gpu-validation>

– Hidden Layers Shape Validation:

- \* Description: Enter an invalid hidden layers shape.
- \* Data Value: "test"
- \* Data Type: Erroneous
- \* Expected Result: The exception should be handled and a useful error message should be displayed.
- \* Actual Result: Expected Result
- \* Test Status: Pass
- \* Evidence:

Link to video evidence: <https://github.com/mcttn22/school-project/blob/main/project-report/input-validation-testing-videos.md/#hidden-layers-shape-validation>

- Load Model Frame:
  - Use GPU Validation:
    - \* Description: Select Use GPU checkbox without a GPU present.
    - \* Expected Result: The exception should be handled and a useful error message should be displayed.
    - \* Actual Result: Expected Result
    - \* Test Status: Pass
    - \* Evidence:

Link to video evidence: <https://github.com/mcttn22/school-project/blob/main/project-report/input-validation-testing-videos.md/#hidden-layers-shape-validation>

- Test Frames:

- Taken Trained Model Name Validation:

- \* Description: Try to save a trained model with an already taken name.
    - \* Data Value: "test"
    - \* Data Type: Erroneous
    - \* Expected Result: The exception should be handled and a useful error message should be displayed.
    - \* Actual Result: Expected Result
    - \* Test Status: Pass
    - \* Evidence:

Link to video evidence: <https://github.com/mcttn22/school-project/blob/main/project-report/input-validation-testing-videos.md/#hidden-layers-shape-validation>

– Empty Trained Model Name Validation:

- \* Description: Try to save a trained model with blank name.
- \* Data Value: ""
- \* Data Type: Erroneous
- \* Expected Result: The exception should be handled and a useful error message should be displayed.
- \* Actual Result: Expected Result
- \* Test Status: Pass
- \* Evidence:

Link to video evidence: <https://github.com/mcttn22/school-project/blob/main/project-report/input-validation-testing-videos.md/#hidden-layers-shape-validation>

## 4.3 Automated Testing

### 4.3.1 Unit Tests

Within the test package, I have written the following unit tests for the utils subpackage of both the cpu and gpu subpackage of the models package. Similarly to the code for the cpu and gpu subpackage, it is only worth showing the code for the cpu version as both are very similar in functionality.

- test\_model.py module:

```
1  """Unit tests for model module."""
2
3  import os
4  import unittest
5  import uuid
```

```

6
7 import numpy as np
8
9 # Test XOR implementation of Model for its lesser computation time
10 from school_project.models.cpu.xor import XORModel
11
12 class TestModel(unittest.TestCase):
13     """Unit tests for model module."""
14     def __init__(self, *args, **kwargs) -> None:
15         """Initialise unit tests and inputs."""
16         super(TestModel, self).__init__(*args, **kwargs)
17
18     def test_train_dataset_size(self) -> None:
19         """Test the size of training dataset to be value chosen."""
20         train_dataset_size = 4
21         model = XORModel(hidden_layers_shape = [100, 100],
22                           train_dataset_size = train_dataset_size,
23                           learning_rate = 0.1,
24                           use_relu = True)
25         model.create_model_values()
26         model.train(epoch_count=1)
27         self.assertEqual(first=model.layers.head.input.shape[1],
28                           second=train_dataset_size)
29
30     def test_network_shape(self) -> None:
31         """Test the neuron count of each layer to match the set shape of
↪ the
32         network."""
33         layers_shape = [2, 100, 100, 1]
34         model = XORModel(hidden_layers_shape = [100, 100],
35                           train_dataset_size = 4,
36                           learning_rate = 0.1,
37                           use_relu = True)
38         model.create_model_values()
39         model.train(epoch_count=1)
40         for count, layer in enumerate(model.layers):
41             self.assertEqual(first=layer.input_neuron_count,
42                               second=layers_shape[count])
43

14         """Test ReLu output range to be >=0."""
15         test_inputs = [-100, 0, 100]
16         for test_input in test_inputs:
17             output = tools.relu(z=test_input)
18             self.assertGreaterEqual(a=output, b=0)
19
20     def test_sigmoid(self) -> None:
21         """Test sigmoid output range to be within 0-1."""
22         test_inputs = [-100, 0, 100]
23         for test_input in test_inputs:
24             output = tools.sigmoid(z=test_input)
25             self.assertTrue(expr=output >= 0 and output <= 1)
26
27 if __name__ == '__main__':
28     unittest.main()

```

---

### 4.3.2 GitHub Automated Testing

With the following configuration programmed in the .github/workflows/tests.yml file, the unit tests are run automatically on GitHub servers after each commit that is pushed to GitHub, and the status of the tests (either passing or failing) can be viewed on the repository's page. This automatic testing allows for a faster workflow and allows me to identify which changes (commits) cause issues within the code, allowing for easier maintenance of the project.

---

```

1  name: Tests
2
3  on:
4      push:
5          branches: [ "main" ]
6      pull_request:
7          branches: [ "main" ]
8
9  permissions:
10     contents: read
11
12  jobs:
13      build:
14
15          runs-on: ubuntu-latest
16
17          steps:
18              - uses: actions/checkout@v3
19              - name: Set up Python 3.10

```

---

```

20     uses: actions/setup-python@v3
21     with:
22       python-version: "3.10"
23   - name: Install dependencies
24     run: |
25       python -m pip install --upgrade pip
26       pip install numpy
27   - name: Test
28     run: |
29       python -m unittest discover ./school_project/test/models/cpu

```

---

### 4.3.3 Docker

I also provide a basic Dockerfile and instructions for its use in the README.md file, so that the project can be quickly run and tested in Docker containers. Below shows the contents of the basic Dockerfile:

---

```

1 FROM python:3.11
2
3 # Set a directory for the app
4 WORKDIR /usr/src/app
5
6 # Copy all the files to the container
7 COPY . .
8
9 # Install dependencies
10 RUN python setup.py install
11
12 # Run the project
13 CMD ["python", "./school_project"]

```

---

## 5 Evaluation TODO

### 5.1 Project Objectives Evaluation

#### 5.1.1 Project Objectives

For the reader's convenience, I have restated the project objectives below:

Objective ID	Description
1	Learn how Artificial Neural Networks work and develop them from first principles
2	Implement the Artificial Neural Networks by creating trained models on image datasets
2.1	Allow use of Graphics Cards for faster training
2.2	Allow for the saving and loading of trained models
3	Develop a Graphical User Interface
3.1	Provide controls for hyper-parameters of models
3.2	Display and compare the results each model's predictions

### 5.1.2 Project Objective Evaluations

Objective ID	Evaluation	Status
1	I have learnt how Artificial Neural Networks work from online resources, reports and interviewing a subject matter expert. I have proven the key mathematical principles from first principles and implemented these structures within Python code.	Fully met
2	I have implemented trainable Artificial Neural Networks with configurable numbers of layers, number of neurons in each layer and the nature of the Transfer Functions. The Artificial Neural Networks have been trained and tested on a variety of datasets and operates at an accuracy level comparable with the resources learnt from.	Fully met
2.1	The Artificial Neural Networks allow the use of a graphics card where applicable.	Fully met
2.2	The trained Artificial Neural Networks' weights and biases can be saved to a data file and the features of the corresponding Artificial Neural Networks are saved to a database. These saved Artificial Neural Networks can be loaded independently.	Fully met
3	A Graphical User Interface allowing configuration of all hyper-parameters, loading and saving of trained models and testing has been developed.	Fully met
3.1	The Graphical User Interface allows user configuration of all utilised model hyper-parameters.	Fully met
3.2	The model predictions can be compared in terms of both learning rate and overall accuracy.	Fully met

## 5.2 Third Party Feedback

## 5.3 Future Improvements
